Crimp & Cleave Termination Instructions
for 50 and 62.5 µm GiHCS®, 200 µm HCS® LC Connectors

For Use With:
50 and 62.5 µm GiHCS® 2.2 mm Fiber Optic Cables

200 µm HCS® 2.2 mm Fiber Optic Cables

LC and LC Duplex Crimp & Cleave Connectors
Please Read First

Please make sure to READ and understand termination instructions completely. Improper assembly will cause poor termination results and cause damage to termination kit components.

Make sure you WEAR eye protection during the termination process. Bare optical fiber is sharp and may splinter; handle very carefully and make use of the provided fiber optic shard disposal container.

OFS WARRANTS this termination kit to be free of defects for a period of 90 days from the date of purchase. Each kit is qualified at our factory prior to shipment. OFS will, at our discretion, repair or replace tools suspected defective due to our workmanship within the stated warranty period. This excludes damage to any kit component due to improper use.

Termination Instructions

STEP 1
Install Strain Relief Boot

- Slide STRAIN RELIEF BOOT (tapered end first) onto cable end and slide approximately 3 inches [76 mm] out of way.

STEP 2
Remove Outer Cable Jacket

- Mark cable outer jacket 2.5 inches [63.5 mm] from cable end with a marker
- Using 2nd hole (marked 1.6) from the open side of the cable jacket strip tool, remove the 2.5 inches [63.5 mm] of outer jacket..

STEP 3
Remove ETFE Buffer

- Insert the buffered fiber through the guide tube of the ETFE Buffer Strip Tool, all the way in until the cable jacket bottoms out inside it.
- Holding cable securely, squeeze the tool’s handles to cut ETFE buffer then PULL STRAIGHT to remove the ETFE buffer.
- With alcohol prep pad folded in two, wipe surface of fiber where the ETFE buffer was just removed.

NOTE:
Be careful while handling the ETFE Buffer Strip Tool. Handle it as a precision device and do not strike on hard surfaces or drop.

Be sure to clean the ETFE Buffer Strip Tool’s blades frequently using the small bristle brush provided.

NOTE:
If unable to insert ETFE buffered fiber through the guide tube, trim tip of the fiber using scissors. If a short length of cable is being terminated, wrap the cable around your finger to prevent fiber from being pulled out of cable jacket.
Install Connector Body

- Locate the CONNECTOR BODY subassembly into the CRIMP TOOL nest as shown. Close the crimp tool handles lightly to secure connector in nest, but do not yet apply crimp.

- Insert stripped fiber into CONNECTOR BODY subassembly until the cable jacket bottoms out inside the connector.

- Squeeze handles of CRIMP TOOL to apply crimp. CRIMP TOOL will not release until fully crimped.

- Remove CONNECTOR from CRIMP TOOL nest. Slide up and install BOOT onto CONNECTOR.

NOTE:
Be careful not to touch the GiHCS fiber coated surface once the fiber has had the ETFE buffer removed. The coating may retain finger oils which can transfer to and damage the gripper pads in the cleave tool during later termination process steps.
Termination Instructions

**STEP 5**

Cleave Optical Fiber

- Holding the CLEAVE TOOL in a horizontal position, grip the handle while leaving your index finger free to actuate trigger.

- Gently insert CONNECTOR BODY into cleave tool as shown. Be sure to have it fully inserted and release the CONNECTOR BODY.

- Using index finger, slowly depress trigger to perform the cleave operation. The cleave process is complete when the optical fiber snaps away from the connector. Do not release the trigger just yet!

- Before releasing the trigger, remove CONNECTOR BODY from the cleave tool and grasp the optical fiber scrap while releasing the trigger. Gently remove the scrap fiber from the cleave tool while keeping it away from the tool’s diamond blade. Place the scrap optical fiber into the fiber optic shard container for safe disposal.

**STEP 6**

Install Anti-snag Latch or Duplexing Clip

**Simplex Connector:**

- Spread the clip slightly as shown.

- Install the clip around the connector, aligning as shown. Wrap around and snap on to secure.

**Duplex Connector:**

- Spread the clip slightly as shown.

- Install the clip around the connectors, aligning as shown. Wrap around and snap on to secure.

**NOTE:**

Careful while handling the Cleave Tool. Handle it as a precision device and do not strike on hard surfaces or drop. Keep the Cleave Tool clean and free from oils, including naturally occurring finger oils. The diamond blade and gripper pads should be cleaned often (e.g. every 50 cleaves).

Use OFS Cleave Tool Cleaning Kit Part # P16247 – available separately. Do not use isopropyl alcohol to clean any part of the Cleave Tool, especially near the gripper pads as alcohol may ruin them.

Do not insert metal tools near the diamond blade as it is quite sensitive and very fragile and can chip.

Make sure the CONNECTOR BODY is fully seated in the Cleave Tool. Do not hold onto the CONNECTOR BODY during the cleave process as this may induce undesirable torsion stress which will have adverse effect on cleave surface quality.
Maintenance

Importance of Cleave Tool Cleaning

The Cleave Tool included with OFS’ Termination kits contains movable parts, wear items, and a diamond blade that require regular maintenance, care, or replacement in order to perform satisfactorily. Damage and parts replacement expense can result if recommended procedures and techniques are not followed.

- Diamond blade and gripper pads must be cleaned, kept oil free, and replaced if broken or worn
- The Cleave Tool trigger must be depressed slowly to allow the tool to work properly

Cleave Tool Cleaning Kit

For cleaning your cleave tool, please order the OFS Cleave Tool Cleaning Kit (part #P16247) which includes recommended cleaning fluid, swabs, and complete instructions.

Trouble Shooting Guide

<table>
<thead>
<tr>
<th>Problem</th>
<th>Dim-light termination/ no light termination</th>
<th>Poor cleave quality / High insertion loss</th>
<th>Fiber does not cleave</th>
<th>Fiber protrudes or recesses too much after cleave</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Improper ETFE strip technique resulting in HCS coating scratch. <em>See step 3.</em></td>
<td>Diamond blade needs to be cleaned or replaced if chipped. Gripper pads needs to be cleaned or replaced if too worn. Cleave tool trigger depressed too quickly. Improper crimp retention causing fiber to slip with respect to connector.</td>
<td>CONNECTOR BODY not fully inserted into cleave tool during cleave process. Did not let go of CONNECTOR BODY during cleave process. Diamond Blade chipped or broken.</td>
<td>Gripper pads need to be cleaned or replaced because the fiber is slipping through them. Improper cleave technique. Improper crimp retention causing fiber to slip with respect to connector. CONNECTOR BODY not fully inserted into cleave tool during cleave process.</td>
</tr>
